

**50 mA, 3  $\mu$ A supply current low drop linear regulator**

Datasheet - production data

The PMOS pass element allows very good dropout values (200 mV at 25 mA  $I_O$  and 350 mV at full load) without affecting the consumption characteristics.

Housed in the very small SOT323-5L, it meets space-saving requirements in battery-powered equipment.

**Table 1. Device summary**

SOT323-5L (T&R)	Output voltage
STLQ50C18R	1.8 V
STLQ50C25R	2.5 V
STLQ50C33R	3.3 V
STLQ50C50R	5.0 V
STLQ50C-R	Adjustable

## Features

- 2.3 V to 12 V input voltage range
- 50 mA maximum output current
- 3  $\mu$ A quiescent current
- Available in 1.8 V, 2.5 V, 3.3 V, 5.0 V and adjustable voltage
- 200 mV dropout voltage at 25 mA output current
- Internal thermal protection
- Available in SOT323-5L package

## Applications

- Portable/battery-powered equipment
- Electronic sensors
- Microcontroller power
- Real-time clock backup power

## Description

The STLQ50 is a BiCMOS linear regulator specifically designed for operating in environments where very low power consumption is required.

Its very low quiescent current (3  $\mu$ A) results in extended battery life, making the device suitable for applications which have very long standby time.

### 3 Maximum ratings

**Table 3. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_I$	DC Input voltage	-0.3 to +14	V
$V_{ADJ}$	ADJ pin voltage	-0.3 to +7	V
ESD	Human body model	$\pm 2$	kV
$T_J$	Junction temperature	-40 to 150	$^{\circ}\text{C}$
$T_{STG}$	Storage temperature range	-55 to 150	$^{\circ}\text{C}$

*Note:* Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

**Table 4. Thermal data**

Symbol	Parameter	SOT323-5L	Unit
$R_{thJA}$	Thermal resistance junction-ambient	331.4 <sup>(1)</sup>	$^{\circ}\text{C}/\text{W}$

1. This value is referred to a 4-layer PCB, JEDEC standard test board.

## 4 Electrical characteristics

$V_I = V_{O(NOM)} + 1\text{ V}$  or  $V_I = 2.5\text{ V}$  if  $V_O < 1.5\text{ V}$ ;  $T_A = -40\text{ °C}$  to  $125\text{ °C}$ ;  $I_O = 1\text{ mA}$ ; typical values are at  $T_A = 25\text{ °C}$ ,  $C_O = 1\text{ }\mu\text{F}$  unless otherwise specified.

**Table 5. Electrical characteristics**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$V_I$	Input voltage range	$I_O = 20\text{ mA}$	2.3		12	V
		$I_O = 50\text{ mA}$	2.5		12	
$I_Q$	Quiescent current (measured on ground pin, fixed version)	$V_I = 5\text{ V}$		3.5	5.0	$\mu\text{A}$
		$V_I = 12\text{ V}$		4.1	6.0	
$V_O$	Output voltage range (STLQ50ADJ)		1.222		11	V
	Accuracy as percentage of nominal voltage at $T_J = 25\text{ °C}$		-2		+2	%
$V_{DROD-MAX}$	Max dropout voltage <sup>(1)</sup>	$I_O = 50\text{ mA}$ ;		0.4	0.7	V
$\Delta V_O$	Load regulation	$1\text{ mA} < I_O < 50\text{ mA}$			0.15	%/mA
$\Delta V_O$	Line regulation	$V_O = 1.5\text{ V}$ ; $V_O + 1\text{ V} < V_I < 12\text{ V}$ ; $V_O < 1.5\text{ V}$ ; $2.5\text{ V} < V_I < 12\text{ V}$ ;			0.3	%/V
SVR	Supply voltage rejection	$V_{RIPPLE} = 0.1\text{ V}$ , $I_O = 20\text{ mA}$ , $f = 120\text{ Hz}$		30		dB
eN	Output noise voltage	$B_W$ from 200 Hz to 100 kHz; $I_O = 10\text{ mA}$		560		$\mu\text{V}_{RMS}$
$T_h$	Thermal protection			160		$^{\circ}\text{C}$
$I_{OMAX}$	Maximum output current <sup>(2)</sup>	$V_O = 0\text{ V}$		500		mA

1.  $V_I = 2.5\text{ V}$  when  $V_{O(NOM)} \leq 2.1\text{ V}$

2. The maximum power dissipation must not be exceeded, see application information for details.

## 7 Application information

The STLQ50 is a BiCMOS linear regulator specifically designed for operating in environments with very low power consumption requirements. The very low quiescent current of 3  $\mu\text{A}$  is obtained through the use of CMOS technology which makes the device suitable for application that have long standby time. Its very low power consumption allows extended battery life and the tiny packages (SOT323-5L) satisfy the space-saving requirements of battery-powered equipment. Moreover, the STLQ50 provides wide input voltage operation from 2.5 V up to 12 V.

The PMOS pass element also permits a very good dropout values of 0.7 V at full load and at 125 °C without affecting consumption characteristics.

### 7.1 External components

The typical application schematic of the STLQ50 is shown in [Figure 4 - Figure 5](#), 1  $\mu\text{F}$  input and output capacitors placed close to the device are required for proper operation. The device is stable with electrolytic and ceramic output capacitors having values higher than 1  $\mu\text{F}$  (see [Figure 11](#) for stability details).

In the adjustable version the output voltage is programmed using an external resistor divider, as shown in [Figure 5](#). The output voltage can be adjusted from 1.22 to 11 V and it can be calculated using the following equation:

#### Equation 1

$$V_O = V_{FB} \times (1 + R_1/R_2)$$

where  $V_{FB} = 1.222 \text{ V}$  is the internal reference voltage.

The sum of the  $R_1$  and  $R_2$  resistors should be chosen in order to guarantee at least 1  $\mu\text{A}$  of divider current. Lower value resistors improve the noise performance but the quiescent current will increase. Higher value resistors should be avoided because the ADJ leakage current will influence the voltage set by the resistor divider, rendering the formula above no longer valid.

The suggested design procedure is to choose  $R_2 = 1 \text{ M}\Omega$  and then calculate  $R_1$  using the following equation:

#### Equation 2

$$R_1 = (V_O/V_{FB} - 1) \times R_2$$

### 7.2 Power dissipation

In order to ensure proper operation, the STLQ50 junction temperature should never exceed 125 °C; this limits the maximum power dissipation the regulator can sustain in any application. The maximum power dissipation can be calculated as:

#### Equation 3

$$P_{D\text{MAX}} = (T_{J\text{MAX}} - T_A)/R_{\text{thJA}}$$

where  $T_{J\text{MAX}} = 125 \text{ }^\circ\text{C}$ ;

$T_A$  is the ambient temperature;

$R_{thJA}$  is the junction-to-ambient thermal resistance of the package (see [Table 4](#) thermal data).

The power dissipation can be calculated simply as:

#### Equation 4

$$P_D = (V_I - V_O) \times I_O$$

In every application condition,  $P_D$  must be lower than  $P_{DMAX}$ .

## 7.3 Protection

The PMOS pass element has an internal diode with anode connected to  $V_O$  and cathode to  $V_I$ . In case  $V_O > V_I$ , the current will flow from output to input without limitation. In this case, a proper limiting network is recommended.

The current limitation is automatically provided by the characteristics of the PMOS pass element (see typical characteristics), so the short-circuit current is dependent on the input voltage. When considering short-circuit current, take care in any case not to exceed the maximum sustainable power dissipation of the device.

The STLQ50 features an internal thermal protection that linearly reduces the output current when the internal temperature increases. Consequently, at a given load, the output voltage decreases also. The action of the thermal protection starts at 125 °C when the output voltage slightly decreases, while close to 163 °C the output voltage drops to 0 V. Since this is a linear control, sudden overcurrent conditions can quickly raise the chip temperature without giving time for the thermal protection to act, so it cannot be used as a limitation for the output current.

## 8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.
